Where are we?

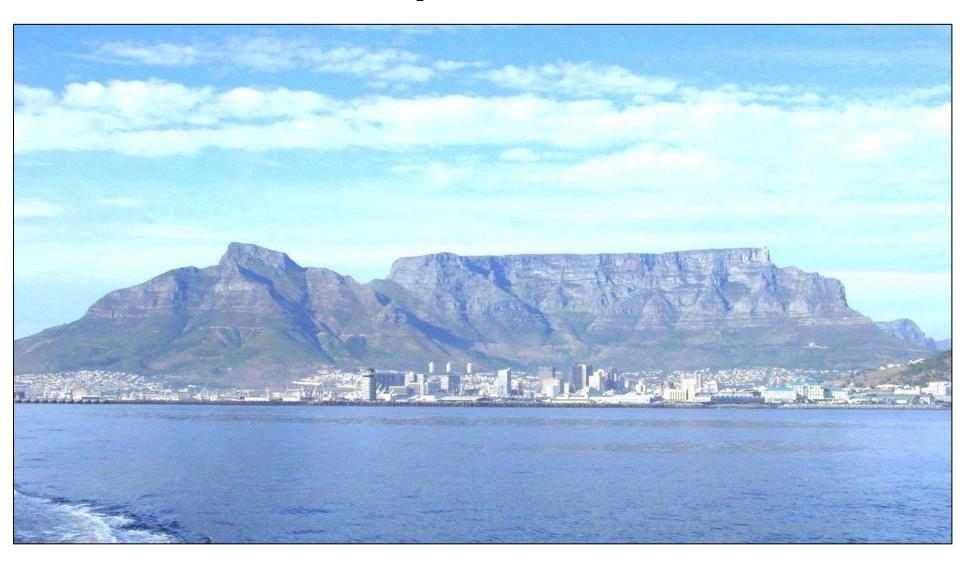

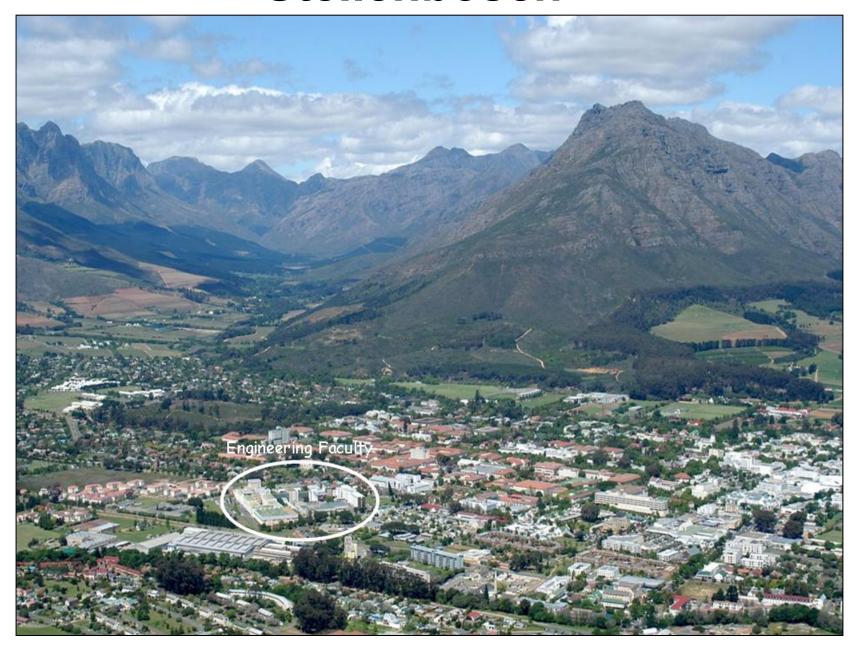

Cape Town

Stellenbosch

South Africa

Johannesburg is the largest city in South Africa.

South Africa

Johannesburg – alternative reality! Inspired by current illegal immigrant problem in Johannesburg.

NEILL BLOMKAMP

The healthcare need....

Billions of people are without basic healthcare.

- 3000 children die every day of treatable diseases.
- HIV/AIDS, TB, Malaria etc.
- Doctor to patient ratio unfavourable...
- Most African countries lack adequate medical personnel:
 - Europe 1 : 15 000
 - Africa 1: 2 000 000

Solutions....

Train more healthcare professionals – three times the current count & force them to work in the middle of "nowhere".

Build more hospitals and clinics – at least three times the current count.

WILL THIS WORK?

Solutions with hope

Innovation and technology are the only hope for a widespread impact on healthcare.

We need to use the time of medical professionals more efficiently.

We need more clinics functioning with "virtual" professionals.

Technology can achieve the above and one can decrease the cost and increase the access of healthcare significantly - so much so that a poor patient can pay or his own "private" healthcare.

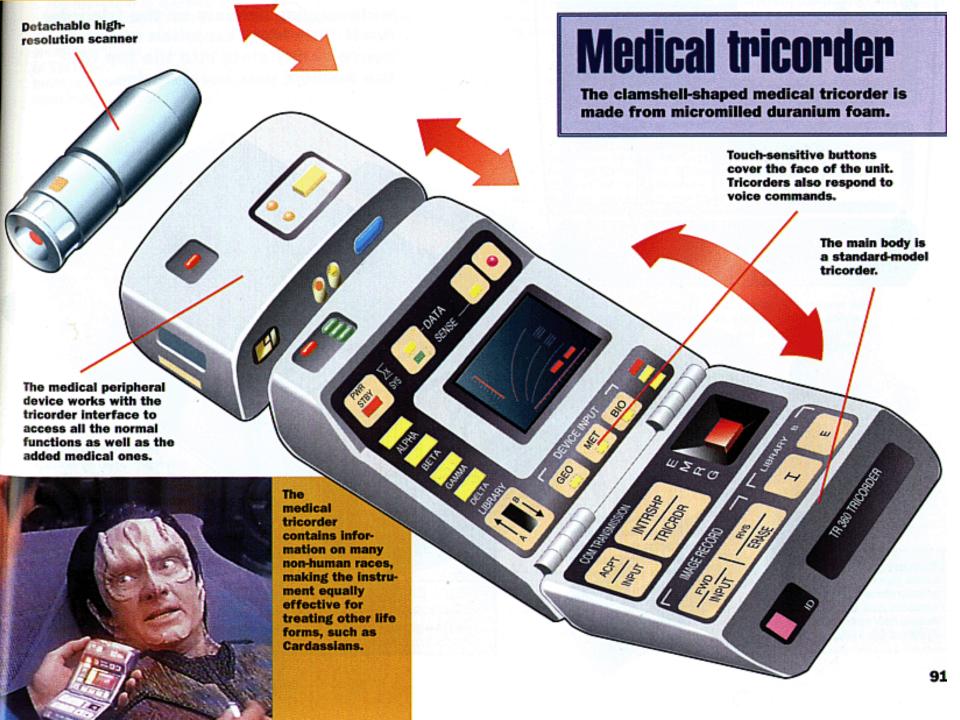

Model is financially attractive & sustainable.

Automation

- How does one save the time of a professional so that he / she can see more patients automate!
- Combine automated technology like automated medical devices with a basically trained healthcare facilitator to perform the time-consuming work (e.g. history taking).
- Automation: Examine a patient automatically, utilize auto-interpretations, automatically monitor that automated tests are performed compliantly, etc.
- Automate the time-consuming parts of healthcare!

Edited by H. GERNSBACK

Telemedicine

- We want to empower medical doctor to examine a patient over telecommunication wire as if he was physically present & examined the patient with his own hands.
- Automate the process of collecting data as much as possible.

Telemedicine

Advanced technologies applied to non-medical scenarios currently exist extensively in the world, but practical applications in the examination of patients in the primary consultation scenario lacks dramatically.

A very basic example, for instance, is that no generally available device exists to measure a basic knee reflex without the interpretation skills of a medical doctor.

Brief overview of completed and current projects involving aspects of E-medicine

AKULTEIT INGENIEURSWES ACULTY OF ENGINEERING

Heart & lung sounds, ECG and ICG

Heart sounds & ECG

FAKULTEIT INGENIEURSWESE FACULTY OF ENGINEERING

Lung sounds

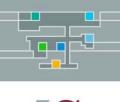

Gait analysis

Inertial motion capture for clinical gait analysis via telemedicine.

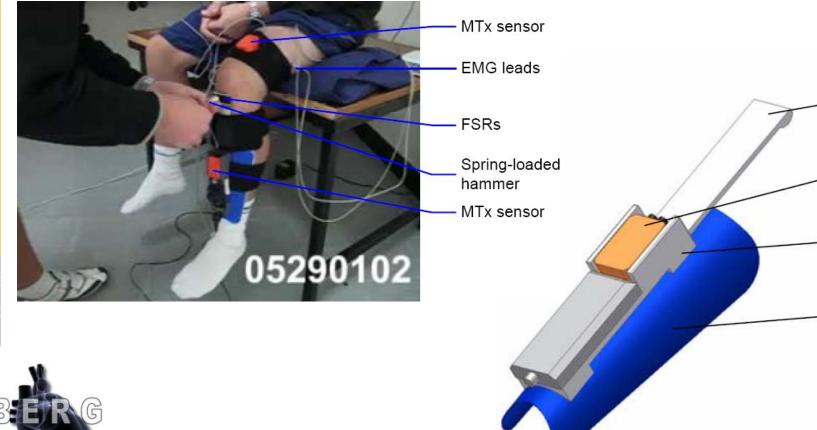

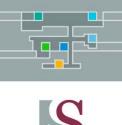

Reflex sensing system

Semi-autonomous recording and classification of reflexes.

Detecting swollen lymph nodes

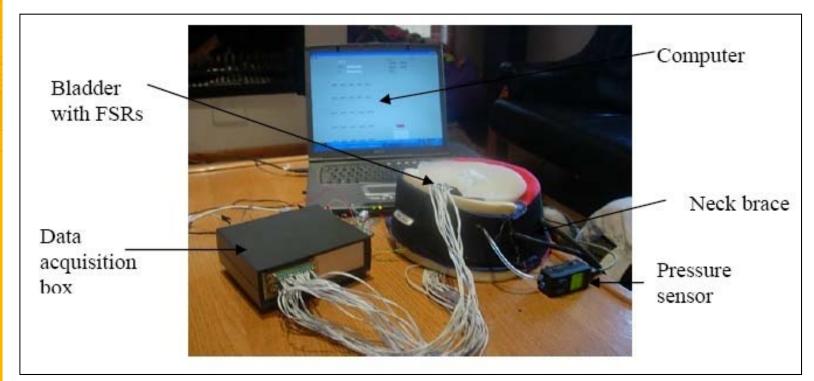

"Neck palpation device"

Detecting swollen lymph nodes

Emulate percussion of liver

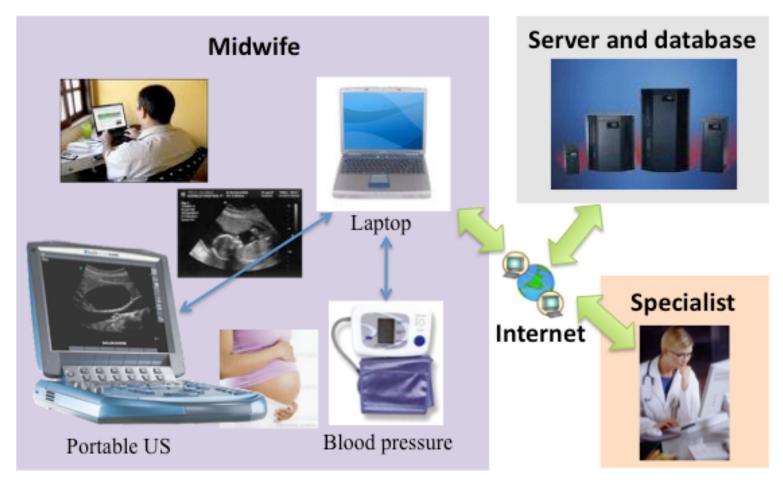

FAKULTEIT INGENIEURSW FACULTY OF ENGINEERING

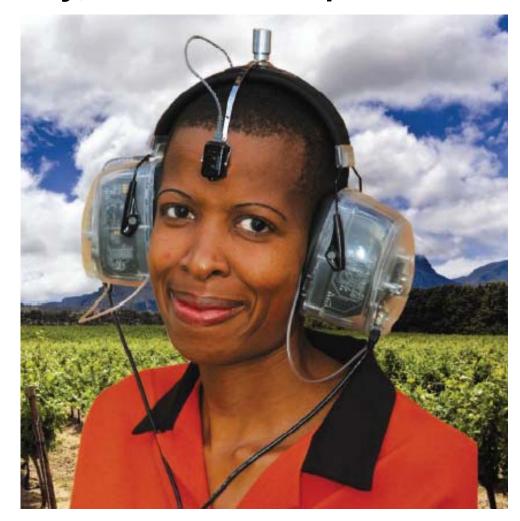

Ultrasound E-medicine platform

Tele-audiology device (KuduWave)

Can perform hearing test remotely & automatically, without sound-proof booth.

Conclusion

- Significant potential if devices are reliable and at a reasonable cost.
- Can bring more work for doctor, rather than "replace" him.
